Food Safety Test Results – Summary

At Fresh Farm Goodness (FFG), food safety and transparency are at the core of everything we do. This report presents the results of independent laboratory testing conducted on an FFG egg sample, helping customers understand the safety and quality of the eggs they consume.

What this report covers

This laboratory report focuses on microbiological safety testing, specifically checking for harmful bacteria that are important indicators of food safety in eggs. The tests were conducted by an independent, NABL-accredited laboratory, following nationally recognised testing standards.

Why this matters

Certain bacteria, such as **Salmonella** and **E. coli**, can pose health risks if present in food. Regular testing ensures that eggs reaching our customers meet strict safety benchmarks and comply with food safety best practices. Publishing these reports is part of our commitment to openness, accountability, and consumer trust.

What the results show

- › **Salmonella**: Not detected in the tested sample
- › **E. coli**: Well within safe and acceptable limits

These results indicate that the tested batch of FFG eggs meets established microbiological safety standards at the time of testing.

FFG conducts such tests regularly and consistently, and updated reports are shared to help customers make informed, confident choices.
